

# Package ‘cbsodataR’

August 20, 2019

**Type** Package

**Title** Statistics Netherlands (CBS) Open Data API Client

**Version** 0.3.4

**Description** The data and meta data from Statistics Netherlands (<<https://www.cbs.nl>>) can be browsed and downloaded. The client uses the open data API of Statistics Netherlands.

**License** GPL-2

**URL** <https://github.com/edwindj/cbsodataR>

**BugReports** <https://github.com/edwindj/cbsodataR/issues>

**Encoding** UTF-8

**Imports** whisker, jsonlite, utils

**Suggests** knitr, rmarkdown, dplyr, shiny

**VignetteBuilder** knitr

**RoxygenNote** 6.1.1

**NeedsCompilation** no

**Author** Edwin de Jonge [aut, cre],  
Sara Houweling [ctb]

**Maintainer** Edwin de Jonge <[edwindjonge@gmail.com](mailto:edwindjonge@gmail.com)>

**Repository** CRAN

**Date/Publication** 2019-08-20 12:30:02 UTC

cbsodataR-package      *Download all data from Statistics Netherlands / CBS*

---

## Description

cbsodataR allows to download all official statistics of Statistics Netherlands (CBS) into R. For a introduction please visit the [vignette](#): `vignette("cbsodataR", package="cbsodataR")`. The functions `cbs_get_toc()` and `cbs_get_data()` should get you going.

## Catalog function

- `cbs_get_toc()`, returns a data.frame with table of contents (toc): the publication meta data for all available tables

## Data retrieval

- `cbs_get_data()`, returns the data of a specific opendata/StatLine table
- `cbs_download_table()`, saves the data (and metadata) as csv files into a directory

## Meta data

- `cbs_get_meta()`, returns the meta data objects of a specific opendata / StatLine table .
- `cbs_add_date_column()`, converts date/period codes into DateTime objects in the data set that was downloaded.
- `cbs_add_label_columns()`, adds labels to the code columns in the data that was downloaded.

**Author(s)**

**Maintainer:** Edwin de Jonge <edwindjonge@gmail.com>

Other contributors:

- Sara Houweling [contributor]

---

cache_clear	<i>clears the cache</i>
-------------	-------------------------

---

**Description**

clears the cache

**Usage**

```
cache_clear()
```

---

cbs_add_date_column	<i>Convert the time variable into either a date or numeric.</i>
---------------------	---

---

**Description**

Time periods in data of CBS are coded: yyyyXXww (e.g. 2018JJ00, 2018MM10, 2018KW02), which contains year (yyyy), type (XX) and index (ww). `cbs_add_date_column` converts these codes into a `Date()` or numeric. In addition it adds a frequency column denoting the type of the column.

**Usage**

```
cbs_add_date_column(x, date_type = c("Date", "numeric"), ...)
```

**Arguments**

x	data.frame retrieved using <code>cbs_get_data()</code>
date_type	Type of date column: "Date", "numeric". Numeric creates a fractional number which signs the "middle" of the period. e.g. 2018JJ00 -> 2018.5 and 2018KW01 -> 2018.167. This is for the following reasons: otherwise 2018.0 could mean 2018, 2018 Q1 or 2018 Jan, and furthermore 2018.75 is a bit strange for 2018 Q4. If all codes in the dataset have frequency "Y" the numeric output will be integer.
...	future use.

**Value**

original dataset with two added columns: `<period>_date` and `<period>_freq`. This last column is a factor with levels: Y, Q and M

**See Also**

Other data retrieval: [cbs\\_add\\_label\\_columns](#), [cbs\\_download\\_data](#), [cbs\\_extract\\_table\\_id](#), [cbs\\_get\\_data\\_from\\_link](#), [cbs\\_get\\_data](#)

Other meta data: [cbs\\_add\\_label\\_columns](#), [cbs\\_download\\_meta](#), [cbs\\_get\\_meta](#)

---

`cbs_add_label_columns` *For each column with codes add label column to data set*

---

**Description**

Adds cbs labels to the dataset that was retrieved using [cbs\\_get\\_data\(\)](#).

**Usage**

```
cbs_add_label_columns(x, columns = colnames(x), ...)
```

**Arguments**

<code>x</code>	data.frame retrieved using <a href="#">cbs_get_data()</a> .
<code>columns</code>	character with the names of the columns for which labels will be added
<code>...</code>	not used.

**Details**

Code columns will be translated into label columns for each of the column that was supplied.

By default all code columns will be accompanied with a label column. The name of each label column will be `<code_column>_label`.

**Value**

the original data.frame `x` with extra label columns. (see description)

**See Also**

Other data retrieval: [cbs\\_add\\_date\\_column](#), [cbs\\_download\\_data](#), [cbs\\_extract\\_table\\_id](#), [cbs\\_get\\_data\\_from\\_link](#), [cbs\\_get\\_data](#)

Other meta data: [cbs\\_add\\_date\\_column](#), [cbs\\_download\\_meta](#), [cbs\\_get\\_meta](#)

**Examples**

```
## Not run:

# get data for main (000000) Consumer Price Index (7196ENG) for March 2000,
x <- cbs_get_data( id      = "7196ENG"
                  , Periods = "2000MM03" # March 2000
                  , CPI     = "000000"  # main price index
                  )
cbs_add_label_columns(x)

## End(Not run)
```

---

`cbs_default_selection` *extract the default selection from a cbsodata meta object*

---

**Description**

extract the default selection from a cbsodata meta object

**Usage**

```
cbs_default_selection(x, ...)
```

**Arguments**

<code>x</code>	meta object
<code>...</code>	for future use

---

`cbs_download_data` *Gets all data from a cbs table.*

---

**Description**

Gets all data via bulk download. `cbs_download_data` dumps the data in (international) csv format.

**Usage**

```
cbs_download_data(id, path = file.path(id, "data.csv"), ...,
                 select = NULL, typed = TRUE, verbose = FALSE,
                 base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

id	of cbs open data table
path	of data file, defaults to "<id>/data.csv"
...	optional filter statements to select rows of the data,
select	optional names of columns to be returned.
typed	Should the data automatically be converted into integer and numeric?
verbose	show the underlying downloading of the data
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

**See Also**

Other download: [cbs\\_download\\_meta](#), [cbs\\_download\\_table](#)

Other data retrieval: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_extract\\_table\\_id](#), [cbs\\_get\\_data\\_from\\_link](#), [cbs\\_get\\_data](#)

---

cbs\_download\_meta      *Dumps the meta data into a directory*

---

**Description**

Dumps the meta data into a directory

**Usage**

```
cbs_download_meta(id, dir = id, ..., verbose = FALSE, cache = FALSE,
  base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

id	Id of CBS open data table (see <a href="#">cbs_get_toc()</a> )
dir	Directory in which data should be stored. By default it creates a sub directory with the name of the id
...	not used
verbose	Print extra messages what is happening.
cache	Should meta data be cached?
base_url	optionally allow to specify a different server. Useful for third party data services implementing the same protocol.

**Value**

meta data object

**See Also**

Other meta data: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_get\\_meta](#)

Other download: [cbs\\_download\\_data](#), [cbs\\_download\\_table](#)

---

cbs\_download\_table      *Download a table from statistics Netherlands*

---

**Description**

`cbs_download_table` downloads the data and metadata of a table from statistics Netherlands and stores it in csv format.

**Usage**

```
cbs_download_table(id, ..., dir = id, cache = FALSE, verbose = TRUE,
  typed = FALSE, base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

<code>id</code>	Identifier of CBS table (can be retrieved from <a href="#">cbs_get_toc()</a> )
<code>...</code>	Parameters passed on to <a href="#">cbs_download_data()</a>
<code>dir</code>	Directory where table should be downloaded
<code>cache</code>	If metadata is cached use that, otherwise download meta data
<code>verbose</code>	Print extra messages what is happening.
<code>typed</code>	Should the data automatically be converted into integer and numeric?
<code>base_url</code>	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Details**

`cbs_download_table` retrieves all raw meta data and data and stores these as csv files in the directory specified by `dir`. It is possible to add a filter. A filter is specified with `<column_name> = <values>` in which `<values>` is a character vector. Rows with values that are not part of the character vector are not returned.

**Value**

meta data object of id [cbs\\_get\\_meta\(\)](#).

**See Also**

Other download: [cbs\\_download\\_data](#), [cbs\\_download\\_meta](#)

## Examples

```
## Not run:  
  
# download meta data and data from inflation/Consumer Price Indices  
download_table(id="7196ENG")  
  
## End(Not run)
```

---

`cbs_extract_table_id` *extract the id of a cbs table from the statline url*

---

## Description

extract the id of a cbs table from the statline url

## Usage

```
cbs_extract_table_id(url, ...)
```

## Arguments

<code>url</code>	character with hyperlink to StatLine table
<code>...</code>	future use.

## Value

character with id, will be NA if not found.

## See Also

Other data retrieval: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_download\\_data](#), [cbs\\_get\\_data\\_from\\_link](#), [cbs\\_get\\_data](#)

---

`cbs_get_data` *Get data from Statistics Netherlands (CBS)*

---

## Description

Retrieves data from a table of Statistics Netherlands. A list of available tables can be retrieved with [cbs\\_get\\_toc\(\)](#). Use the Identifier column of `cbs_get_toc` as `id` in `cbs_get_data` and `cbs_get_meta`.

**Usage**

```
cbs_get_data(id, ..., select = NULL, typed = TRUE,
             add_column_labels = TRUE, dir = tempdir(), verbose = FALSE,
             base_url = getOption("cbsodataR.base_url", BASE_URL),
             include_ID = FALSE)
```

**Arguments**

<code>id</code>	Identifier of table, can be found in <a href="#">cbs_get_toc()</a>
<code>...</code>	optional filter statements, see details.
<code>select</code>	character optional, columns to select
<code>typed</code>	Should the data automatically be converted into integer and numeric?
<code>add_column_labels</code>	Should column titles be added as a label (TRUE) which are visible in View
<code>dir</code>	Directory where the table should be downloaded. Defaults to temporary directory
<code>verbose</code>	Print extra messages what is happening.
<code>base_url</code>	optionally specify a different server. Useful for third party data services implementing the same protocol.
<code>include_ID</code>	Should the data include the ID column for the rows?

**Details**

To reduce the download time, optionally the data can be filtered on category values: for large tables (> 100k records) this is a wise thing to do.

The filter is specified with `<column_name> = <values>` in which `<values>` is a character vector. Rows with values that are not part of the character vector are not returned. Note that the values have to be raw (un-recoded) values.

By default the columns will be converted to their type (`typed=TRUE`). CBS uses multiple types of missing (unknown, suppressed, not measured, missing): users wanting all these nuances can use `typed=FALSE` which results in character columns.

**Value**

`data.frame` with the requested data. Note that a csv copy of the data is stored in `dir`.

**Note**

All data are downloaded using [cbs\\_download\\_table\(\)](#)

**See Also**

[cbs\\_get\\_meta\(\)](#), [cbs\\_download\\_data\(\)](#)

Other data retrieval: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_download\\_data](#), [cbs\\_extract\\_table\\_id](#), [cbs\\_get\\_data\\_from\\_link](#)

**Examples**

```
## Not run:

# get data for main (000000) Consumer Price Index (7196ENG) for March 2000,
cbs_get_data( id      = "7196ENG"      # table id
              , Periods = "2000MM03"  # March 2000
              , CPI     = "000000"    # Category code for total
              )

## End(Not run)
```

---

```
cbs_get_data_from_link
```

*Retrieve data from a link created from the StatLine app.*

---

**Description**

Retrieve data from a link created from the StatLine app.

**Usage**

```
cbs_get_data_from_link(link, message = TRUE, ...,
                       base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

link	url/hyperlink to opendata table made with the StatLine App
message	logical Should the query be printed (default TRUE)
...	passed on to <a href="#">cbs_get_data</a>
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Value**

Same as [cbs\\_get\\_data](#)

**See Also**

Other data retrieval: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_download\\_data](#), [cbs\\_extract\\_table\\_id](#), [cbs\\_get\\_data](#)

---

cbs_get_meta	<i>Get metadata of a cbs table</i>
--------------	------------------------------------

---

### Description

Retrieve the meta data of a CBS open data table. Caching (cache=TRUE) improves the performance considerably.

### Usage

```
cbs_get_meta(id, verbose = FALSE, cache = TRUE,
             base_url = getOption("cbsodataR.base_url", BASE_URL))
```

### Arguments

id	internal id of CBS table, can be retrieved with <a href="#">cbs_get_toc()</a>
verbose	Print extra messages what is happening.
cache	should the result be cached?
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

### Details

The meta data of a CBS table is determined by the web api of Statistics Netherlands. cbsodataR stays close to this API. Each cbsodataR object has the following metadata items, which are all data.frames :

- \$TableInfos: data.frame with the descriptive publication metadata of the table, such as Title, Description, Summary etc.
- \$DataProperties: data.frame with the Title, Description, Unit etc. of each column in the dataset that is downloaded with [cbs\\_get\\_data\(\)](#).
- \$CategoryGroups: hierarchical groupings of the code columns.
- \$<code column>: for each code column a data.frame with the Title, Key, Description etc. of each code / category in that column. e.g. Perioden for time codes c("2019JJ00", "2018JJ00").

### Value

cbs\_table object containing several data.frames with meta data (see details)

### See Also

Other meta data: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_download\\_meta](#)

---

`cbs_get_meta_from_dir` *Load meta data from a downloaded table*

---

**Description**

Load meta data from a downloaded table

**Usage**

```
cbs_get_meta_from_dir(dir)
```

**Arguments**

`dir` Directory where data was downloaded

**Value**

`cbs_table` object with meta data

---

`cbs_get_tables_themes` *Get a the list of tables connected to themes*

---

**Description**

Get a the list of tables connected to themes

**Usage**

```
cbs_get_tables_themes(..., select = NULL, verbose = FALSE,
  cache = TRUE, base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

`...` Use this to add a filter to the query e.g. `get_tables_themes(ID=10)`.

`select` character vector with names of wanted properties. default is all

`verbose` Print extra messages what is happening.

`cache` Should the result be cached?

`base_url` optionally specify a different server. Useful for third party data services implementing the same protocol.

**Value**

A data.frame with various properties of SN/CBS themes.

---

cbs_get_themes	<i>Get list of all cbs thematic entries.</i>
----------------	--

---

### Description

Returns a list of all cbs themes.

### Usage

```
cbs_get_themes(..., select = NULL, verbose = TRUE, cache = FALSE,  
  base_url = getOption("cbsodataR.base_url", BASE_URL))
```

### Arguments

...	Use this to add a filter to the query e.g. <code>get_themes(ID=10)</code> .
select	character vector with names of wanted properties. default is all
verbose	Print extra messages what is happening.
cache	Should the result be cached?
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

### Value

A data.frame with various properties of SN/CBS themes.

The filter is specified with `<column_name> = <values>` in which `<values>` is a character vector. Rows with values that are not part of the character vector are not returned.

### Examples

```
## Not run:  
# get list of all themes  
cbs+get_themes()  
  
# get list of all dutch themes from the Catalog "CBS"  
cbs_get_themes(Language="nl", Catalog="CBS")  
  
## End(Not run)
```

---

cbs\_get\_toc

*Retrieve a data.frame with requested cbs tables*

---

### Description

cbs\_get\_toc by default a list of all tables and all columns will be retrieved. You can restrict the query by supplying multiple filter statements or by specifying the columns that should be returned.

### Usage

```
cbs_get_toc(..., convert_dates = TRUE, select = NULL,
  verbose = FALSE, cache = TRUE,
  base_url = getOption("cbsodataR.base_url", BASE_URL),
  include_ID = FALSE)
```

### Arguments

...	filter statement to select rows, e.g. Language="nl"
convert_dates	convert the columns with date-time information into DateTime (default TRUE)
select	character columns to be returned, by default all columns will be returned.
verbose	logical prints the calls to the webservice
cache	logical should the result be cached?
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.
include_ID	logical column needed by OData but with no current use.

### Value

data.frame with identifiers, titles and descriptions of tables

### Note

cbs\_get\_toc will cache results, so subsequent calls will be much faster.

### Examples

```
## Not run:

# get list of english tables
tables_en <- cbs_get_toc(Language="en")

# get list of dutch tables
tables_nl <- cbs_get_toc(Language="nl")
View(tables_nl)

## End(Not run)
```

---

 download\_data-deprecated

*Gets all data from a cbs table.*

---

### Description

This method is deprecated in favor of [cbs\\_download\\_data\(\)](#).

### Usage

```
download_data(id, path = file.path(id, "data.csv"), ..., select = NULL,
  typed = FALSE, verbose = TRUE,
  base_url = getOption("cbsodataR.base_url", BASE_URL))
```

### Arguments

id	of cbs open data table
path	of data file, defaults to "<id>/data.csv"
...	optional filter statements to select rows of the data,
select	optional names of columns to be returned.
typed	Should the data automatically be converted into integer and numeric?
verbose	show the underlying downloading of the data
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

### See Also

Other download: [cbs\\_download\\_meta](#), [cbs\\_download\\_table](#)

Other data retrieval: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_extract\\_table\\_id](#), [cbs\\_get\\_data\\_from\\_link](#), [cbs\\_get\\_data](#)

---

 download\_meta-deprecated

*Dumps the meta data into a directory*

---

### Description

This method is deprecated in favor of [cbs\\_download\\_meta\(\)](#).

### Usage

```
download_meta(id, dir = id, ..., verbose = FALSE, cache = FALSE,
  base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

id	Id of CBS open data table (see <a href="#">cbs_get_toc()</a> )
dir	Directory in which data should be stored. By default it creates a sub directory with the name of the id
...	not used
verbose	Print extra messages what is happening.
cache	Should meta data be cached?
base_url	optionally allow to specify a different server. Useful for third party data services implementing the same protocol.

**Value**

meta data object

**See Also**

Other meta data: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_get\\_meta](#)

Other download: [cbs\\_download\\_data](#), [cbs\\_download\\_table](#)

---

download\_table-deprecated

*Download a table from statistics Netherlands*

---

**Description**

This method is deprecated in favor of [cbs\\_download\\_table\(\)](#).

**Usage**

```
download_table(id, ..., dir = id, cache = FALSE, verbose = TRUE,
              typed = FALSE, base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

id	Identifier of CBS table (can be retrieved from <a href="#">cbs_get_toc()</a> )
...	Parameters passed on to <a href="#">cbs_download_data()</a>
dir	Directory where table should be downloaded
cache	If metadata is cached use that, otherwise download meta data
verbose	Print extra messages what is happening.
typed	Should the data automatically be converted into integer and numeric?
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Details**

`cbs_download_table` retrieves all raw meta data and data and stores these as csv files in the directory specified by `dir`. It is possible to add a filter. A filter is specified with `<column_name> = <values>` in which `<values>` is a character vector. Rows with values that are not part of the character vector are not returned.

**Value**

meta data object of id `cbs_get_meta()`.

**See Also**

Other download: [cbs\\_download\\_data](#), [cbs\\_download\\_meta](#)

**Examples**

```
## Not run:

# download meta data and data from inflation/Consumer Price Indices
download_table(id="7196ENG")

## End(Not run)
```

---

get\_data-deprecated     *Get data from Statistics Netherlands (CBS)*

---

**Description**

This method is deprecated in favor of `cbs_get_data()`

**Usage**

```
get_data(id, ..., recode = TRUE, use_column_title = recode,
         dir = tempdir(), base_url = getOption("cbsodataR.base_url",
         BASE_URL))
```

**Arguments**

<code>id</code>	Identifier of table, can be found in <code>cbs_get_toc()</code>
<code>...</code>	optional filter statements, see details.
<code>recode</code>	recodes all codes in the code columns with their Title as found in the metadata
<code>use_column_title</code>	not used.
<code>dir</code>	Directory where the table should be downloaded. Defaults to temporary directory
<code>base_url</code>	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Details**

To reduce the download time, optionally the data can be filtered on category values: for large tables (> 100k records) this is a wise thing to do.

The filter is specified with `<column_name> = <values>` in which `<values>` is a character vector. Rows with values that are not part of the character vector are not returned. Note that the values have to be raw (un-recoded) values.

By default the columns will be converted to their type (`typed=TRUE`). CBS uses multiple types of missing (unknown, suppressed, not measured, missing): users wanting all these nuances can use `typed=FALSE` which results in character columns.

**Value**

`data.frame` with the requested data. Note that a csv copy of the data is stored in `dir`.

**See Also**

[cbs\\_get\\_meta\(\)](#), [cbs\\_download\\_data\(\)](#)

Other data retrieval: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_download\\_data](#), [cbs\\_extract\\_table\\_id](#), [cbs\\_get\\_data\\_from\\_link](#)

**Examples**

```
## Not run:

# get data for main (000000) Consumer Price Index (7196ENG) for March 2000,
cbs_get_data( id      = "7196ENG"      # table id
              , Periods = "2000MM03"   # March 2000
              , CPI     = "000000"     # Category code for total
              )

## End(Not run)
```

---

`get_meta-deprecated`     *Get meta data from table*

---

**Description**

This method is deprecated in favor of [cbs\\_get\\_meta\(\)](#)

**Usage**

```
get_meta(id, verbose = TRUE, cache = FALSE,
         base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

id	internal id of CBS table, can be retrieved with <a href="#">cbs_get_toc()</a>
verbose	Print extra messages what is happening.
cache	should the result be cached?
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Details**

The meta data of a CBS table is determined by the web api of Statistics Netherlands. `cbsodataR` stays close to this API. Each `cbsodataR` object has the following metadata items, which are all `data.frames` :

- `$TableInfos`: `data.frame` with the descriptive publication metadata of the table, such as Title, Description, Summary etc.
- `$DataProperties`: `data.frame` with the Title, Description, Unit etc. of each column in the dataset that is downloaded with [cbs\\_get\\_data\(\)](#).
- `$CategoryGroups`: hierarchical groupings of the code columns.
- `$<code column>`: for each code column a `data.frame` with the Title, Key, Description etc. of each code / category in that column. e.g. `Perioden` for time codes `c("2019JJ00", "2018JJ00")`.

**Value**

`cbs_table` object containing several `data.frames` with meta data (see details)

**See Also**

Other meta data: [cbs\\_add\\_date\\_column](#), [cbs\\_add\\_label\\_columns](#), [cbs\\_download\\_meta](#)

---

`get_meta_from_dir`      *Load meta data from a downloaded table*

---

**Description**

Load meta data from a downloaded table

**Usage**

```
get_meta_from_dir(dir)
```

**Arguments**

dir	Directory where data was downloaded
-----	-------------------------------------

**Value**

`cbs_table` object with meta data

---

get_tables_themes	<i>Get a the list of tables connected to themes</i>
-------------------	---

---

**Description**

Get a the list of tables connected to themes

**Usage**

```
get_tables_themes(..., select = NULL,
  base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

...	Use this to add a filter to the query e.g. <code>get_tables_themes(ID=10)</code> .
select	character vector with names of wanted properties. default is all
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Value**

A `data.frame` with various properties of SN/CBS themes.

---

get_table_list	<i>Retrieve a data.frame with requested cbs tables</i>
----------------	--

---

**Description**

This method is deprecated in favor of `cbs_get_toc()`.

**Usage**

```
get_table_list(..., select = NULL,
  base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

...	filter statement to select rows, e.g. <code>Language="nl"</code>
select	character columns to be returned, by default all columns will be returned.
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Value**

`data.frame` with identifiers, titles and descriptions of tables

**Examples**

```
## Not run:

# get list of english tables
tables_en <- get_table_list(Language="en")

# get list of dutch tables
tables_nl <- get_table_list(Language="nl")
View(tables_nl)

## End(Not run)
```

---

get_themes	<i>Get list of all cbs thematic entries.</i>
------------	--

---

**Description**

Returns a list of all cbs themes.

**Usage**

```
get_themes(..., select = NULL, verbose = TRUE, cache = FALSE,
  base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

...	Use this to add a filter to the query e.g. <code>get_themes(ID=10)</code> .
select	character vector with names of wanted properties. default is all
verbose	Print extra messages what is happening.
cache	Should the result be cached?
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Value**

A data.frame with various properties of SN/CBS themes.

The filter is specified with `<column_name> = <values>` in which `<values>` is a character vector. Rows with values that are not part of the character vector are not returned.

**Examples**

```
## Not run:
# get list of all themes
get_themes()

# get list of all dutch themes from the Catalog "CBS"
get_themes(Language="nl", Catalog="CBS")

## End(Not run)
```

---

resolve_deeplink	<i>resolve a deeplink created in the opendata portal</i>
------------------	--

---

**Description**

resolve a deeplink created in the opendata portal

**Usage**

```
resolve_deeplink(deeplink, ...,  
  base_url = getOption("cbsodataR.base_url", BASE_URL))
```

**Arguments**

deeplink	url to the deeplink in the opendataportal
...	used in the query
base_url	optionally specify a different server. Useful for third party data services implementing the same protocol.

**Value**

information object with table id, select, filter and query statement.
